

AI Food Scanner App – India Focused (Detailed PRD)

1. Product Vision

Build a mobile app that scans Indian meals and provides calorie estimation, health classification, and personalized quantity suggestions. Focus on practical usability over perfect accuracy.

2. Target Users

- Working professionals (22–40)
- Gym beginners / weight loss users
- People with lifestyle diseases (diabetes, PCOS, BP)
- Students and homemakers

3. Indian Eating Patterns

- Breakfast: Poha, Paratha, Idli, Dosa, Bread
- Lunch/Dinner: Roti, Sabzi, Dal, Rice
- Snacks: Samosa, chai, biscuits, namkeen
- Mixed plates (Thali) are common

4. Regional Variations

- North India: Roti, paneer, high oil/ghee
- South India: Rice-based, idli/dosa, coconut
- West India: Gujarati (light/sweet), Maharashtrian (spicy)
- East India: Rice, fish, sweets

5. Core Features

- Food detection via image
- Approx calorie estimation
- Health indicator (Good / Moderate / Avoid)
- Quantity suggestions based on goal
- User profile (age, weight, goal)
- Daily calorie tracking

6. AI & Technical Approach

- Use pretrained APIs (Google ML Kit, etc.)
- No custom model in MVP
- Rule-based logic for health classification
- Basic portion estimation using assumptions

7. App Flow

- User opens app
- Clicks food image
- AI detects items
- Displays calories + health status
- Shows recommendation (e.g., reduce quantity)

8. UI Strategy

- Simple and visual UI
- Use color indicators (Green/Yellow/Red)
- Minimal text, clear suggestions

9. Monetization

- Freemium model
- Subscription: ₹99–₹199/month
- B2B: gyms and dieticians

10. Challenges

- Indian food recognition accuracy
- Mixed food detection
- Portion estimation limitations

11. Differentiation

Instead of just showing calories, provide actionable advice like 'Reduce rice by 30%' or '2 rotis are enough'.

12. MVP Timeline

- Week 1: UI + camera
- Week 2: AI integration
- Week 3: logic + suggestions

13. Future Scope

- Voice input
- Smart plate hardware integration
- Disease-specific diet recommendations
